An Independent Evaluation of VR-Design Studio
(formerly UC-win/Road)

The following is a summary of a recent evaluation of our software by a Dutch based Simulation Engineering Company working on a project for a major Rehabilitation Research Institute…

"I really enjoyed working with your product. Here is a summary of my evaluation."

"Easy to use software packages with a clear, intuitive interface to design a new VDB or Driving Scenario. Roads can be designed very easily with a 2D overview which allows you to design roads in every shape you want. After the road topology is done, it is easy to graphically fill the scene with use of dragging and dropping of imported models or existing models of the large online database. Everything you design is graphical which means: WYSIWYG. In my opinion, your software is one of the best COTS driving simulator software packages than can be used for a research simulator because it's easy to setup various driving environments without too much technological background. Therefore, research can easily setup their own experiments to analyze their specific driving behaviour. Besides that, it is also possible to create more complex driving scenarios with use of the SDK but I didn't really look into this feature because this wasn't part of the trial version."
